INTRODUCTION

The nature of my job as a costume designer requires me to design and create new garments and costumes for specific productions.

This catalogue of fabrics was created with the aim of implementing more environmentally-sustainable and ethical practices into my work process without the need to compromise on the quality of design or function, and to share my findings with other designers and theatre and dance professionals.

My hope is that this resource will make it easier to effectively and efficiently source more sustainably-produced fabrics, and be a small step towards reducing the environmental footprint of theatre and dance productions.

The following table collates my findings grouped into fabric categories, together with useful information on weight and composition and a direct link to the supplier's website for more details. Where appropriate, certain fabrics may appear in more than one table.

The majority of fabrics listed are available on a "no or low" minimum order, with reliable stock levels for re-ordering and delivery options to the EU.

Suppliers should be contacted directly with regards to sustainability verification, samples, and questions regarding the ordering process.

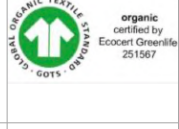

For more information about my design work, collaborative ideas or to chat about sustainable practices in dance and theatre, please do not hesitate to get in touch.

FIBRE DEFINITIONS

ANIMAL FIBRES

PEACE SILK / AHIMSA SILK

Peace silk, also known as Ahimsa silk or non-violent silk, refers to any silk produced without harming or killing the silkworms. It allows the completion of the metamorphosis of the silkworm to its moth stage, whereas most silk harvesting requires the silkworms to be killed in their cocoon stage. No animals suffer or die for the silk to be produced, making it an alternative to normal silk for those who object to harming animals.

Peace silk requires 10 extra days in the process to let the larvae grow and for the moths to hatch out of the cocoons. In contrast, the more usual process takes about 15 minutes, but to many might not be acceptable when considering animal welfare.

WOOL

Wool is naturally a renewable, biodegradable and durable fibre. It is an extremely insulating textile in cold temperatures, helping to trap body heat within the fibres to maintain warmth.

Organic wool is made from sheep that are raised on organic farms that do not use pesticides, herbicides or chemical fertilisers.

Recycled wool is wool that has already been turned into fabric (and sometimes garments) and has been re-worked into another product. Recycling wool reduces textile waste and limits chemical use for dyeing. Because the wool used to produce recycled wool fabric is sometimes already dyed, specific colours can be combined into a recycled textile to create the desired hue, rather than bleaching and re-dyeing, thus reducing the use of additional chemicals.

PLANT FIBRES

BAMBOO

Bamboo fibre and fabric are made from the pulp of bamboo grass. Bamboo fabric is light, strong, has excellent wicking properties and is soft next to the skin. The bamboo plant is very quick growing and does not usually require the use of pesticides and herbicides to thrive. As a result, plantations can remain organic and be replanted yearly to replenish stocks.

ORGANIC COTTON

Organic cotton is a sustainable alternative method of growing cotton. It is an eco-friendly solution that avoids the use of pesticides, chemicals, fertilisers and genetically modified seeds. Organic cotton promotes healthier practices for both the environment and production workers, including the use of natural and low impact processing materials, as well as fairer working conditions.

HEMP

Hemp fabric is a textile made using fibres that come from the stalks of the Cannabis Sativa plant. This durable fabric has been around for thousands of years, requires less land for production than cotton and releases fewer toxins into the environment. It is highly breathable, absorptive and durable.

LINEN

Linen comes from the flax plant, and is one of the oldest natural fibres used by humans. The flax plant requires less water to cultivate than other textile crops like cotton, can be grown without pesticides and produces multiple by-products such as linseed oil and ground flaxseed food products. It is a very strong and durable fabric that can be used in any warm weather due to it being breathable, sweat-wicking, and quick-drying.

REGENERATED FIBRES

CUPRO

Cupro, short for “cuprammonium rayon”, is a plant-based, semi-synthetic fabric made from cotton linter — a product of cotton production. It can also be extracted from recycled cotton garments. Cupro material is breathable and regulates temperature like cotton; it also drapes elegantly and resembles silk to the touch. Alternative names for cupro fabric are cupra, ammonia silk and Bemberg.

ECOVERO VISCOSE

Ecovero is a branded viscose produced by solubilising cellulose extracted from sustainable wood from controlled sources: FSC (Forest Stewardship Council) or PEFC (Program for Endorsement of Forest Certification Schemes). It is manufactured in Austria by the company Lenzing.

It is considered a semi-synthetic material, is light and breathable and can absorb 4 times its weight in water.

TENCEL / LYOCELL / MODAL

Lyocell and Modal are both semi-synthetic fibres made from wood and plant cellulose. Lyocell is often made from wood pulp from oak, birch or eucalyptus trees and Modal from beech tree pulp.

Tencel refers to a brand of Lyocell and Modal fibres manufactured by the Austrian textile company Lenzing and being produced from wood pulp from sustainably managed sources it is in addition a renewable resource.

TRIACETATE

Triacetate is a modified and improved form of acetate. It is a semi-synthetic fibre made from combining wood pulp from trees with acetic acid. The fabric is soft, wrinkle-resistant, has a good drape and is easy to care for.

RECYCLED FIBRES

RECYCLED POLYESTER AND NYLON

Recycled polyester (RPET) and nylon use the process of recycling already-used items to create new products, thereby reducing waste and reliance on landfill sites.

The plastic waste is broken down and re-processed to create fabric. The plastic used as the base of recycled polyester/nylon typically comes from plastic bottles, post-industrial plastic waste, old rugs, carpets, textile waste, used garments, fishing nets and reclaimed marine debris.

Although more sustainable than creating new polyester or nylon fibres, recycled polyester and nylon are still not biodegradable or compostable.

DIGITAL PRINTING

Digitally printing patterns and solid colours onto fabric can be considered more sustainable than traditional fabric printing and dyeing due to a huge reduction in water and power consumption and water pollution. By only printing the amount of fabric needed for a garment or project, wastage is minimal.

The colour and pattern possibilities are infinite allowing designers to achieve the exact colour-tone, scale or illusion of texture required.

House of U is a digital textile printing company based in the Netherlands offering a range of sustainable/eco fabric bases including GOTS-certified (Global Organic Textile Standard) and GRS-certified (Global Recycled Standard) fabrics. Print files can easily be uploaded onto their website with a minimum order of 1 metre and fast delivery options.
